

[2017 New Free Lead2pass Microsoft 70-534 PDF Dumps With The Latest Update Exam Questions (1-20)]

2017 June Microsoft Official New Released 70-534 Dumps in Lead2pass.com! 100% Free Download! 100% Pass Guaranteed! No doubt that 70-534 exam is a worth challenging task but you should not feel hesitant against the confronting difficulties. Lead2pass is supplying the new version of 70-534 VCE dumps now. Get a complete hold on 70-534 exam syllabus through Lead2pass and boost up your skills. What's more, the 70-534 dumps are the latest. It would be great helpful to your 70-534 exam. Following questions and answers are all new published by Microsoft Official Exam Center: <http://www.lead2pass.com/70-534.html> Case Study 1 - VanArsdel, Ltd (Question 1 - Question 8)OverviewVanArsdel, Ltd. builds skyscrapers, subways, and bridges. VanArsdel is a leader in using technology to do construction better.OverviewVanArsdel employees are able to use their own mobile devices for work activities because the company recognizes that this usage enables employee productivity. Employees also access Software as a Service (SaaS) applications, including DocuSign, Dropbox, and Citrix. The company continues to evaluate and adopt more SaaS applications for its business. VanArsdel uses Azure Active Directory (AD) to authenticate its employees, as well as Multi-Factor Authentication (MFA). Management enjoys the ease with which MFA can be enabled and disabled for employees who use cloud-based services. VanArsdel's on-premises directory contains a single forest. Helpdesk:VanArsdel creates a helpdesk group to assist its employees. The company sends email messages to all its employees about the helpdesk group and how to contact it. Configuring employee access for SaaS applications is often a time-consuming task. It is not always obvious to the helpdesk group which users should be given access to which SaaS applications. The helpdesk group must respond to many phone calls and email messages to solve this problem, which takes up valuable time. The helpdesk group is unable to meet the needs of VanArsdel's employees.However, many employees do not work with the helpdesk group to solve their access problems. Instead, these employees contact their co-workers or managers to find someone who can help them. Also, new employees are not always told to contact the helpdesk group for access problems. Some employees report that they cannot see all the applications in the Access Panel that they have access to. Some employees report that they must re-enter their passwords when they access cloud applications, even though they have already authenticated. Bring your own device (BYOD):VanArsdel wants to continue to support users and their mobile and personal devices, but the company is concerned about how to protect corporate assets that are stored on these devices. The company does not have a strategy to ensure that its data is removed from the devices when employees leave the company. Customer Support VanArsdel wants a mobile app for customer profile registration and feedback. The company would like to keep track of all its previous, current, and future customers worldwide. A profile system using third-party authentication is required as well as feedback and support sections for the mobile app. Migration:VanArsdel plans to migrate several virtual machine (VM) workloads into Azure. They also plan to extend their on-premises Active Directory into Azure for mobile app authentication. Business Requirements Hybrid Solution:A single account and credentials for both on-premises and cloud applications Certain applications that are hosted both in Azure and on-site must be accessible to both VanArsdel employees and partnersThe service level agreement (SLA) for the solution requires an uptime of 99.9%The partners all use Hotmail.com email addresses Mobile App:VanArsdel requires a mobile app for project managers on construction job sites. The mobile app has the following requirements:The app must display partner information.The app must alert project managers when changes to the partner information occur.The app must display project information including an image gallery to view pictures of construction projects.Project managers must be able to access the information remotely and securely. Security:VanArsdel must control access to its resources to ensure sensitive services and information are accessible only by authorized users and/or managed devices. Employees must be able to securely share data, based on corporate policies, with other VanArsdel employees and with partners who are located on construction job sites. VanArsdel management does NOT want to create and manage user accounts for partners. Technical RequirementsArchitecture:VanArsdel requires a non-centralized stateless architecture fonts data and services where application, data, and computing power are at the logical extremes of the network. VanArsdel requires separation of CPU storage and SQL services Data Storage:VanArsdel needs a solution to reduce the number of operations on the contractor information table. Currently, data transfer rates are excessive, and queue length for read/write operations affects performance.A mobile service that is used to access contractor information must have automatically scalable, structured storage Images must be stored in an automatically scalable, unstructured form. Mobile Apps: VanArsdel mobile app must authenticate employees to the company's Active Directory.Event-triggered alerts must be pushed to mobile apps by using a custom Node.js script.The customer support app should use an identity provider that is configured by using the Access Control Service for current profile registration and authentication. The customer support team will adopt future identity providers that are configured through Access Control Service. Security:Active Directory Federated Server (AD FS) will be used to extend AD into Azure.Helpdesk administrators must have access to only the groups of Azure resources they are responsible for.

Azure administration will be performed by a separate group. IT administrative overhead must be minimized. Permissions must be assigned by using Role Based Access Control (RBAC). Line of business applications must be accessed securely. QUESTION 1 You need to assign permissions for the Virtual Machine workloads that you migrate to Azure. The solution must use the principal of least privileges. What should you do? A. Create all VMs in the cloud service named Group1 and then connect to the Azure subscription. Run the following Windows PowerShell command: `New-AzureRoleAssignment-Mail user1@vanarsdeltd.com?RoleDefinitionName Contributor-ResourceGroupName group1` B. In the Azure portal, select an individual virtual machine and add an owner. C. In the Azure portal, assign read permission to the user at the subscription level. D. Create each VM in a separate cloud service and then connect to the Azure subscription. Run the following Windows PowerShell command: `Get-AzureVM |`

`New-AzureRoleAssignment-Mail user1@vanarsdeltd.com-RoleDefinitionName Contributor` Answer: A Explanation: * Scenario: Permissions must be assigned by using Role Based Access Control (RBAC). * Role-Based access control (RBAC) in the Azure Portal and Azure Resource Management API allows you to manage access to your subscription at a fine-grained level. With this feature, you can grant access for Active Directory users, groups, or service principals by assigning some roles to them at a particular scope. Create a role assignment Use `New-AzureRoleAssignment` to create a role assignment. Example: This will create a role assignment for a group at a resource group level. PS C:> `New-AzureRoleAssignment -ObjectID <group object ID> -RoleDefinitionName Reader -ResourceGroupName group1`

<https://azure.microsoft.com/en-gb/documentation/articles/role-based-access-control-powershell/> QUESTION 2 You need to design the system that alerts project managers to data changes in the contractor information app. Which service should you use? A. Azure Mobile Service B. Azure Service Bus Message Queueing C. Azure Queue Messaging D. Azure Notification Hub Answer: C Explanation: * Scenario: / Mobile Apps: Event-triggered alerts must be pushed to mobile apps by using a custom Node.js script. / The service level agreement (SLA) for the solution requires an uptime of 99.9% * If you are already using Azure Storage Blobs or Tables and you start using queues, you are guaranteed 99.9% availability. If you use Blobs or Tables with Service Bus queues, you will have lower availability. Note: Microsoft Azure supports two types of queue mechanisms: Azure Queues and Service Bus Queues. / Azure Queues, which are part of the Azure storage infrastructure, feature a simple REST-based Get/Put/Peek interface, providing reliable, persistent messaging within and between services. / Service Bus queues are part of a broader Azure messaging infrastructure that supports queuing as well as publish/subscribe, Web service remoting, and integration patterns.

<https://msdn.microsoft.com/en-us/library/azure/hh767287.aspx> QUESTION 3 You need to recommend a solution that allows partners to authenticate. Which solution should you recommend? A. Configure the federation provider to trust social identity providers. B. Configure the federation provider to use the Azure Access Control service. C. Create a new directory in Azure Active Directory and create a user account for the partner. D. Create an account on the VanArsdel domain for the partner and send an email message that contains the password to the partner. Answer: B Explanation: * Scenario: The partners all use Hotmail.com email addresses. * In Microsoft Azure Active Directory Access Control (also known as Access Control Service or ACS), an identity provider is a service that authenticates user or client identities and issues security tokens that ACS consumes. The ACS Management Portal provides built-in support for configuring Windows Live ID as an ACS Identity Provider. Incorrect: Not C, not D: Scenario: VanArsdel management does NOT want to create and manage user accounts for partners.

<https://msdn.microsoft.com/en-us/library/azure/gg185971.aspx> QUESTION 4 You are designing a plan to deploy a new application to Azure. The solution must provide a single sign-on experience for users. You need to recommend an authentication type. Which authentication type should you recommend? A. SAML credential tokens B. Azure managed access keys C. Windows Authentication D. MS-CHAP Answer: A Explanation: A Microsoft cloud service administrator who wants to provide their Azure Active Directory (AD) users with sign-on validation can use a SAML 2.0 compliant SP-Lite profile based Identity Provider as their preferred Security Token Service (STS) / identity provider. This is useful where the solution implementer already has a user directory and password store on-premises that can be accessed using SAML 2.0. This existing user directory can be used for sign-on to Office 365 and other Azure AD-secured resources.

<https://msdn.microsoft.com/en-us/library/azure/dn641269.aspx?f=255&MSPPErr=-2147217396> QUESTION 5 You need to prepare the implementation of data storage for the contractor information app. What should you do? A. Create a storage account and implement multiple data partitions. B. Create a Cloud Service and a Mobile Service. Implement Entity Group transactions. C. Create a Cloud Service and a Deployment group. Implement Entity Group transactions. D. Create a Deployment group and a Mobile Service. Implement multiple data partitions. Answer: B Explanation: * Scenario: / VanArsdel needs a solution to reduce the number of operations on the contractor information table. Currently, data transfer rates are excessive, and queue length for read/write operations affects performance. / A mobile service that is used to access contractor information must have automatically scalable, structured storage * The basic unit of deployment and scale in Azure is the Cloud Service.

<https://msdn.microsoft.com/en-us/library/azure/dd894038.aspx> QUESTION 6 You need to ensure that users do not need to re-enter their passwords after they authenticate to cloud applications for the first time. What should you do? A. Enable Microsoft Account authentication. B. Set up a virtual private network (VPN) connection between the VanArsdel premises and Azure datacenter. Set up a Windows Active Directory domain controller in Azure VM. Implement Integrated Windows authentication. C. Deploy ExpressRoute. D. Configure Azure Active Directory Sync to use single sign-on (SSO). Answer: D Explanation: Single sign-on (SSO) is a property of access control of multiple related, but independent software systems. With this property a user logs in once and gains access to all systems without being prompted to log in again at each of them. http://en.wikipedia.org/wiki/Single_sign-on

QUESTION 7 Drag and Drop Question You need to recommend data storage mechanisms for the solution. What should you recommend? To answer, drag the appropriate data storage mechanism to the correct information type. Each data storage mechanism may be used once, more than once, or not at all. You may need to drag the split bar between panes or scroll to view content. Answer: Explanation: * Use Table storage for Contractor information * Use Blob for Project Images * Scenario: VanArsdel needs a solution to reduce the number of operations on the contractor information table. Currently, data transfer rates are excessive, and queue length for read/write operations affects performance. / A mobile service that is used to access contractor information must have automatically scalable, structured storage / Images must be stored in an automatically scalable, unstructured form. Note: Blob is an acronym for Binary Large object. Basically Blob is a sequence of bytes ? just what an application needs. Blob can hold audio, video, email messages, archived files, zip files or a word processing document in a very general way.

<http://www.thewindowsclub.com/understanding-blob-queue-table-storage-windows-azure> QUESTION 8 Hotspot Question You need to design the contractor information app. What should you recommend? To answer, select the appropriate options in the answer area. Answer: Explanation: - They also plan to extend their on-premises Active Directory into Azure for mobile app authentication - VanArsdel mobile app must authenticate employees to the company's Active Directory.

<https://docs.microsoft.com/en-us/azure/app-service-mobile/app-service-mobile-value-prop> QUESTION 9 You are designing an Azure web application. The solution will be used by multiple customers. Each customer has different business logic and user interface requirements. Not all customers use the same version of the .NET runtime. You need to recommend a deployment strategy. What should you recommend? A. Deploy with multiple web role instances. B. Deploy each application in a separate tenant. C. Deploy all applications in one tenant. D. Deploy with multiple worker role instances. Answer: B Explanation: There are two types of tenant environments. The simplest type is a single-tenant application where one customer has 100% dedicated access to an application's process space. A single Tenant Applications has a separate, logical instance of the application for each customer or client. A single tenant application is much more predictable and stable by its nature since there will never be more than one dedicated customer at any point in time in that VM. That customer has all of its users accessing that dedicated instance of the application. Multi Tenancy and Windows Azure. Overview of Multi tenant Application and Single tenant Application Architectural considerations. <http://sanganakauthority.blogspot.in/2011/12/multi-tenancy-and-windows-azure.html>

QUESTION 10 You design an Azure application that processes images. The maximum size of an image is 10 MB. The application includes a web role that allows users to upload images and a worker role with multiple instances that processes the images. The web role communicates with the worker role by using an Azure Queue service. You need to recommend an approach for storing images that minimizes storage transactions. What should you recommend? A. Store images in Azure Blob service. Store references to the images in the queue. B. Store images in the queue. C. Store images in OneDrive attached to the worker role instances. Store references to the images in the queue. D. Store images in local storage on the web role instance. Store references to the images in the queue. Answer: A Explanation: <https://msdn.microsoft.com/en-gb/library/ff803365.aspx> <https://msdn.microsoft.com/en-us/library/azure/hh767287.aspx>

QUESTION 11 You are designing an Azure application. The application includes two web roles and three instances of a worker role. The web roles send requests to the worker role by using one or more Azure Queues. You need to recommend a queue design for sending requests to the worker role. What should you recommend? A. Create a queue for each combination of web roles and worker role instances. Send requests to all worker role instances based on the sending web role. B. Create a single queue. Send all requests on the single queue. C. Create a queue for each worker role instance. Send requests on each worker queue by using a round robin rotation. D. Create a queue for each web role. Send requests on all queues at the same time. Answer: B Explanation: To communicate with the worker role, a web role instance places messages on to a queue. A worker role instance polls the queue for new messages, retrieves them, and processes them. There are a couple of important things to know about the way the queue service works in Azure. First, you reference a queue by name, and multiple role instances can share a single queue. Second, there is no concept of a typed message; you construct a message from either a string or a byte array. An individual message can be no more than 64 kilobytes (KB) in size. <https://msdn.microsoft.com/en-gb/library/ff803365.aspx>

<http://azure.microsoft.com/en-gb/documentation/articles/cloud-services-dotnet-multi-tier-app-using-service-bus-queues/>

QUESTION 12 You are designing an Azure application that will use a worker role. The worker role will create temporary files. You need to minimize storage transaction charges. Where should you create the files? A. In Azure local storage B. In Azure Storage page blobs C. On an Azure Drive D. In Azure Storage block blobs Answer: A Explanation: Local storage is temporary in Azure. So, if the virtual machine supporting your role dies and cannot recover, your local storage is lost! Therefore, Azure developers will tell you, only volatile data should ever be stored in local storage of Azure. Windows Azure Local File Storage How To Guide And Warnings <http://www.intertech.com/Blog/windows-azure-local-file-storage-how-to-guide-and-warnings/>

<http://blog.codingoutloud.com/2011/06/12/azure-faq-can-i-write-to-the-file-system-on-windowsazure/> QUESTION 13 You are designing an Azure web application. The application uses one worker role. It does not use SQL Database. You have the following requirements: - Maximize throughput and system resource availability - Minimize downtime during scaling You need to recommend an approach for scaling the application. Which approach should you recommend? A. Increase the role instance size B. Set up horizontal partitioning C. Increase the number of role instances D. Set up vertical partitioning Answer: C Explanation: On the Scale page of the Azure Management Portal, you can manually scale your application or you can set parameters to automatically scale it. You can scale applications that are running Web Roles, Worker Roles, or Virtual Machines. To scale an application that is running instances of Web Roles or Worker Roles, you add or remove role instances to accommodate the work load. How to Scale an Application <http://azure.microsoft.com/en-gb/documentation/articles/cloud-services-how-to-scale/> QUESTION 14 You are evaluating an Azure application. The application includes the following elements: - A web role that provides the ASP.NET user interface and business logic - A single SQL database that contains all application data Each webpage must receive data from the business logic layer before returning results to the client. Traffic has increased significantly. The business logic is causing high CPU usage. You need to recommend an approach for scaling the application. What should you recommend? A. Store the business logic results in Azure Table storage B. Vertically partition the SQL database C. Move the business logic to a worker role D. Store the business logic results in Azure local storage Answer: C Explanation: For Cloud Services in Azure applications need both web and worker roles to scale well. Application Patterns and Development Strategies for SQL Server in Azure Virtual Machines

<https://msdn.microsoft.com/en-us/library/azure/dn574746.aspx> QUESTION 15 You are planning an upgrade strategy for an existing Azure application. Multiple instances of the application run in Azure. The management team is concerned about application downtime, due to a business service level agreement (SLA). You are evaluating which change in your environment will require downtime. You need to identify the changes to the environment that will force downtime. Which change always requires downtime? A. Adding an HTTPS endpoint to a web role B. Upgrading the hosted service by deploying a new package C. Changing the value of a configuration setting D. Changing the virtual machine size Answer: A Explanation: If you change the number of endpoints for your service, for example by adding a HTTPS endpoint for your existing Web Role, it will require downtime. Re-Deploying your Windows Azure Service without Incurring Downtime

<http://blog.toddysm.com/2010/06/re-deploying-your-windows-azure-service-without-incurring-downtime.html> QUESTION 16 You are designing an Azure application that processes graphical image files. The graphical Images are processed in batches by remote applications that run on multiple servers. You have the following requirements: - The application must remain operational during batch-processing operations. - Users must be able to roll back each image to a previous version. You need to ensure that each remote application has exclusive access to an image while the application processes the image. Which type of storage should you use to store the images? A. Table service B. Queue service C. Blob service D. A single Azure VHD that is attached to the web role Answer: C Explanation: * Blob Leases allow you to claim ownership to a Blob. Once you have the lease you can then update the Blob or delete the Blob without worrying about another process changing it underneath you. When a Blob is leased, other processes can still read it, but any attempt to update it will fail. You can update Blobs without taking a lease first, but you do run the chance of another process also attempting to modify it at the same time. * You can opt to use either optimistic or pessimistic concurrency models to manage access to blobs and containers in the blob service. Azure Blob Storage Part 8: Blob Leases

<http://justazure.com/azure-blob-storage-part-8-blob-leases/> Using Blob Leases to Manage Concurrency with Table Storage <http://www.azurefromthetrenches.com/?p=1371> QUESTION 17 You are designing an Azure application that stores data. You have the following requirements: - The data storage system must support storing more than 500 GB of data. - Data retrieval must be possible from a large number of parallel threads. - Threads must not block each other. You need to recommend an approach for storing data. What should you recommend? A. Azure Notification Hubs B. A single SQL database in Azure C. Azure Queue storage D. Azure Table storage Answer: D Explanation: * Azure Table Storage can be useful for applications that must store large amounts of nonrelational data, and need additional structure for that data. Tables offer key-based access to unschematized data at a low cost for applications with simplified data-access patterns. While Azure Table Storage stores structured data without schemas, it does not provide any way to represent relationships between the data. * As a solution architect/developer, consider using Azure Table

Storage when:/ Your application stores and retrieves large data sets and does not have complex relationships that require server-side joins, secondary indexes, or complex server-side logic./ You need to achieve a high level of scaling without having to manually shard your dataset. Azure Table Storage and Windows Azure SQL Database - Compared and Contrasted

<https://msdn.microsoft.com/en-us/library/azure/jj553018.aspx> QUESTION 18 You are designing a Windows Azure application. The application includes processes that communicate by using Windows Communications Foundation (WCF) services. The WCF services must support streaming. You need to recommend a host for the processes and a WCF binding. Which two actions should you recommend? (Each correct answer presents part of the solution. Choose two.) A. Host the processes in web roles. B. Host the processes in worker roles. C. Use NetTcpBinding for the WCF services. D. Use WSHttpBinding for the WCF services. Answer: BC

Explanation: [https://msdn.microsoft.com/en-us/library/ms733742\(v=vs.110\).aspx](https://msdn.microsoft.com/en-us/library/ms733742(v=vs.110).aspx) QUESTION 19 You are designing a Windows Azure application. Messages will be placed into a Windows Azure Queue and then processed by a worker role. There is no requirement for adherence to the Windows Azure Service Level Agreement (SLA). You need to recommend an approach for concurrently processing messages while minimizing compute cost. What should you recommend? A. A single role instance that processes messages individually. B. A single role instance with multithreaded request processing. C. Multiple role instances that process messages individually. D. Multiple role instances, each with multithreaded request processing. Answer: B

QUESTION 20 You are designing a Windows Azure application that will use a worker role. The worker role will create temporary files. You need to recommend an approach for creating the temporary files that minimizes storage transactions. What should you recommend? A.

Create the files on a Windows Azure Drive. B. Create the files in Windows Azure local storage. C. Create the files in Windows Azure Storage page blobs. D. Create the files in Windows Azure Storage block blobs. Answer: B

Lead2pass is one of the leading exam preparation material providers. We have a complete range of exams offered by the top vendors. You can download 70-534 dumps in PDF format on Lead2pass.com. Comparing with others', our 70-534 exam questions are more authoritative and complete. What's more, the 70-534 dumps are the latest. We ensure you pass the 70-534 exam easily. 70-534 new questions on Google Drive: <https://drive.google.com/open?id=0B3Syig5i8gpDWU9xQUQzY1NIN1E> 2017 Microsoft 70-534 exam dumps (All 230 Q&As) from Lead2pass: <http://www.lead2pass.com/70-534.html> [100% Exam Pass Guaranteed]
